

 Day 6/14 —

HTML Forms Basics: User Input Lena Seekho

**Aaj hum seekhenge ki HTML me forms kaise banate hain,
jisse hum users se data collect kar sakte hain — jaise name,
email, feedback, etc.**

Form kya hota hai?

Form ek HTML element hai jo **user input** leta hai aur us data ko server par bhejta hai.

Important Tags:

- <form> → Form create karta hai
- <input> → User se single-line data leta hai
- <label> → Input ka naam ya description deta hai
- <textarea> → Multi-line text input
- <button> → Submit ya reset button

Example Code:

```
<!DOCTYPE html>

<html>
  <head>
    <title>HTML Form Example</title>
  </head>
  <body>
    <h1>Contact Form</h1>
    <form action="submit.php" method="post">
      <label for="name">Name:</label>
      <input type="text" id="name" name="username" required>
      <br><br>
      <label for="email">Email:</label>
      <input type="email" id="email" name="useremail" required>
      <br><br>
      <textarea name="message" placeholder="Your message"></textarea>
      <br><br>
      <button type="submit">Send</button>
    </form>
  </body>
</html>
```

Contact Form

Name:

Email:

Your message

Aaj ka task (5 min):

- Upar ka code type karke day6.html me save karo
 - Apna naam, email aur message placeholder change karo
 - Browser me open karo
-

Bonus Tip:

- required attribute use karo taaki field empty submit na ho
- method="post" sensitive data ke liye use karo
